1/15

Health is a major topic, very complex, influenced by:

- Healthcare quality
- Healthcare accessibility
- Healthcare costs

Health is a major topic, very complex, influenced by:

- Healthcare quality
- Healthcare accessibility
- Healthcare costs
- Social conditions
- Economic conditions
- ...

Health is a major topic, very complex, influenced by:

- Healthcare quality
- Healthcare accessibility
- Healthcare costs
- Social conditions
- Economic conditions
- o ...
- \rightarrow Impact of different policies

Research question

Analyse the possibility to create a European microsimulation to assess the effects of socio-economic policies on health and health inequalities.

Research question

Analyse the possibility to create a European microsimulation to assess the effects of socio-economic policies on health and health inequalities.

 \rightarrow Complexity :

EUROMOD :

- Tax-benefit microsimulation model (static)
- for the European Union
- enabling to calculate the effects of taxes and benefits on household incomes and work incentives
- in a comparable manner.

- Tax-benefit microsimulation model (static)
- for the European Union
- enabling to calculate the effects of taxes and benefits on household incomes and work incentives
- in a comparable manner.
- There are three key components to EUROMOD:
 - The coded policy rules,
 - The input micro-data and
 - The software.

- Tax-benefit microsimulation model (static)
- for the European Union
- enabling to calculate the effects of taxes and benefits on household incomes and work incentives
- in a comparable manner.
- There are three key components to EUROMOD:
 - The coded policy rules,
 - The input micro-data and
 - The software.

Instruments simulated: income taxes, social contributions (paid by the employees, self-employed and employers), family benefits, housing benefits, social assistance and other income-related benefits.

Strengths:

- Free
- European
- Modelling very complex tax'system
- Flexible

Image: Image:

3

Strengths:

- Free
- European
- Modelling very complex tax'system
- Flexible

Weaknesses:

- Static
- Changes in policies, without adapting the input variables
- Accessibility to input microdata
- Not really adapted to be called from other codes

Linkage with LIAM2

- LIAM2 (esp. MIDAS_LU)
- Dynamic in Static (Nowcasting)
- Expanded initial input population (from sample)
- Discrete time (image per periode)
- Modules : Ageing, Migrations, Education/Unemployment/Working/Retirement statuses, Gross income, Gross pension rights, Reporting (including yearly exhaustive populations as inputs for the static side)

Linkage with LIAM2

- LIAM2 (esp. MIDAS_LU)
- Dynamic in Static (Nowcasting)
- Expanded initial input population (from sample)
- Discrete time (image per periode)
- Modules : Ageing, Migrations, Education/Unemployment/Working/Retirement statuses, Gross income, Gross pension rights, Reporting (including yearly exhaustive populations as inputs for the static side)
- ullet
 ightarrow the output of EUROMOD not in the dynamic
- ullet ightarrow Health absent

Our proposition: discrete time dynamic microsimulation with EUROMOD as module.

- Static in Dyn
- Discrete time
- Starting from a complete synthetic population (>< sample)
- including all interactions with dynamical loop
- Possible addition of variables not available in EUROMOD
- Each module could use different hypothetical policies

Possible model description: !! work in progress !!

Initial synthetic population

Possible model description: !! work in progress !!

- Initial synthetic population
- Oemographic update: Ageing, death, birth, union of HH, separation of HH, moves, migrations

Possible model description: !! work in progress !!

- Initial synthetic population
- Oemographic update: Ageing, death, birth, union of HH, separation of HH, moves, migrations
- Participation model: Probability to be active or inactive depending on: Age, gender, household, health

- Initial synthetic population
- Oemographic update: Ageing, death, birth, union of HH, separation of HH, moves, migrations
- Participation model: Probability to be active or inactive depending on: Age, gender, household, health
- Gross income model: gross income depending on: Age, gender, household, health and work status

- Initial synthetic population
- Oemographic update: Ageing, death, birth, union of HH, separation of HH, moves, migrations
- Participation model: Probability to be active or inactive depending on: Age, gender, household, health
- Gross income model: gross income depending on: Age, gender, household, health and work status
- EUROMOD : used output = net income

- Initial synthetic population
- Oemographic update: Ageing, death, birth, union of HH, separation of HH, moves, migrations
- Participation model: Probability to be active or inactive depending on: Age, gender, household, health
- Gross income model: gross income depending on: Age, gender, household, health and work status
- EUROMOD : used output = net income
- Health model: self assessed health depending on: Age, gender, household, work status and disposable income

Challenges :

- Transparence
- Level of complexity

3

Challenges :

- Transparence
- Level of complexity
- Code easily adaptable to other countries
- Join different data sources

Challenges :

- Transparence
- Level of complexity
- Code easily adaptable to other countries
- Join different data sources
- EUROMOD already updates some features when simulating next years (still static)
- determine and calibrate each module

Challenges :

- Transparence
- Level of complexity
- Code easily adaptable to other countries
- Join different data sources
- EUROMOD already updates some features when simulating next years (still static)
- determine and calibrate each module
- European? Not in a first phase
- time consideration, with income year shifted

Challenges :

- Transparence
- Level of complexity
- Code easily adaptable to other countries
- Join different data sources
- EUROMOD already updates some features when simulating next years (still static)
- determine and calibrate each module
- European? Not in a first phase
- time consideration, with income year shifted

Limitations:

- Stability? Combining many differents modules
- First call of EUROMOD needed, change in the taxes policy?
- "Garbage in, garbage out"

- Methodologically and technically challenging
- Details count
- Need of several models/modules
- Very flexible (code in R)
- Helpful for decision makers
- ! Versions of EUROMOD
- To be continued...

Nizamul Islam and Marc Suhrcke
